Object Oriented Programming - Study Material

Lecture Notes: Classes, Objects, and Encapsulation

Learning outcomes

1. Explain how classes describe the state and behaviour of objects.
2. Create constructors and use access modifiers to protect object state.
3. Apply encapsulation using private fields and public methods.

Example

A Student class can keep studentNumber and name as private fields.

Its public methods provide the controlled operations needed by the application.

Study task

Create a Course class with code, title and credits. Validate that credits are positive.
